4 Summary

5 RDF is a knowledge representation format (often also referred to as Linked Open Data) which
6 has gained popularity over the years and it continues to be adopted in different domains such
7 as life sciences and humanities. RDF data is typically represented as sets of triples, consisting
8 of subject, predicate and object, and is usually stored in a triple store. SPARQL is one of
9 the most commonly used query languages used to retrieve linked data from a triple store.
10 However writing SPARQL queries is not a trivial task and requires some degree of expertise.

11 Domain experts usually face the challenge of having to learn SPARQL, when all they want is
12 to be able to access the information contained in the triple store. Knowledge engineers with
13 the necessary expertise can help domain experts write SPARQL queries, but they still need to
14 modify part of the query every time they want to extract new data.

15 grlc is a lightweight server that takes SPARQL queries (stored in a GitHub repository, local
16 file storage or listed in a URL), and translates them to Linked Data Web APIs. This enables
17 universal access to Linked Data. Users are not required to know SPARQL to query their
18 data, but instead can access a web API. In this way, grlc enables researchers to easily access
19 knowledge represented in RDF format.

20 grlc uses the [BASIL convention](#) for SPARQL variable mapping and supports LD fragments
21 ([Verborgh et al., 2016](#)).

22 grlc has been used in a number of scientific publications [Lisena et al. \(2019\)](#) and PhD thesis
23 ([Singh, n.d.](#)).

24 Other comparable approaches exist, which allow users to access Linked Open Data without
25 requiring to know SPARQL; for example [OpenPHACTS](#) and RAMOSE ([Daquino et al., 2020](#))
26 are two of the most notable ones.

27 Acknowledgements

28 We acknowledge contributions from Pasquale Lisena, Richard Zijdeman and Rinke Hoekstra.
